Our **Multicut™** cutter set is a unique system that enables you to produce countless profiles on a shaper cutter. These industrial grade Carbide Tipped cutters interlock into each other in a simple setup. This is a very useful and practical set that will save you time and money.

DIMAR'S "MULTICUT" Profile Cutter consists of 5 TCT (Tungsten Carbide Tipped) Cutters, each fitted with 2 Carbide cutting teeth. It enables execution of various profiles, counter profiles and fillings. The cutters are put together at right angles. If necessary, spacers are laid between the hubs.

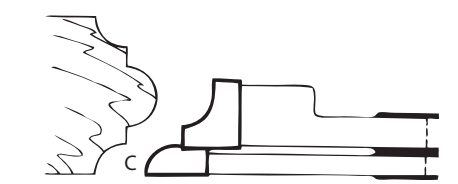

Various moldings are carried out by one or more cutters combined together. Most of them can be executed in one pass, however there may be profiles requiring two or more passes. The few samples shown in this brochure suggests several options out of the multitude combination possibilities.

Counter Profiles are applied at frame, doors, furniture etc. The "Tongue and Groove" system strengthens the joints. The groove profile is cut first. The thickness of the tongue is achieved by the aid of spacers, or by raising or lowering the arbor of the machine.
